EDUCATION

- **University of Oregon** Eugene, OR
Bachelor of Science in Computer Science June 2027

PROJECTS

- **Hunch: Guess by Meaning — iOS Semantic Word Game with On-Device AI (App Store)**
Swift, SwiftUI, Apple Intelligence, Core ML, iOS
 - Designed and built a daily “hot and cold” word game: players guess a secret word by meaning, not spelling, and each guess is scored by semantic similarity with Hot/Warm/Cool feedback — the whole screen warming from icy blue to red as guesses close in.
 - Integrated Apple Intelligence’s on-device language model as “Ask the Keeper,” a yes/no helper that answers questions like “Is it alive?” truthfully without revealing the word, plus AI-generated meaning hints — all on-device with no server round-trip.
 - Shipped the full game loop in SwiftUI: a shared daily word with streaks and shareable results, practice tiers, a coin economy gating hints and questions, achievements, stats, and opt-in daily reminders.
- **Mise: Save Any Recipe — Local-First iOS Cookbook with On-Device Recipe Extraction (App Store)**
Swift, SwiftUI, iCloud sync, iOS, iPadOS
 - Built a local-first cookbook for iPhone and iPad that turns any recipe link, cookbook photo, or imported file into a clean, structured recipe (ingredients, steps, times, photo) — extraction runs entirely on-device, so saved recipes work offline with no account, no ads, and no recipe servers.
 - Shipped the full cooking workflow in SwiftUI: Cook Mode with large glanceable text, an always-awake screen, and per-step timers; serving scaling with instant US/metric unit conversion; and day-by-day meal planning that compiles the week into a single aisle-sorted, shareable grocery list.
 - Designed for privacy and data ownership: recipes live on-device and sync through the user’s own iCloud, with typo-tolerant search, tags and favorites, duplicate detection, shareable scannable recipe cards, and one-tap export of the entire collection.
- **Heirloom — Hardware-Key-Gated Private Group Chat (Live)**
TypeScript, Next.js, WebAuthn, WebSockets, Postgres/Drizzle, Cloudflare R2
 - Shipped a private group chat where membership *is* the physical key: a founder registers a FIDO2 credential, distributes hardware keys to invitees, and revokes by reclaiming a key — no invite links, passwords, or contact-graph leaks.
 - Built the full WebAuthn credential lifecycle: discoverable resident credentials enabling global tap-to-join (keys self-identify, no chat-ID prompt), founder/admin key hierarchy, and revocation flows; real-time messaging over a custom Node WebSocket server.
 - Added image/GIF attachments via Cloudflare R2 with signed-URL delivery; modeled credentials, membership, and message history in Postgres/Drizzle, and deployed on Render alongside a physical key bundle and tiered subscriptions.

EXPERIENCE

- **UO Tutoring and Academic Engagement Center** Eugene, OR
Math & Computer Science Tutor Sept 2024 – Present
 - Diagnose logic, syntax, and runtime errors across Python, C, and C++ using systematic debugging strategies (binary search, invariant checking, stack inspection).
 - Explain recursion, memory models, pointer semantics, and core data structures with examples calibrated to each student’s background.

SKILLS

- **Languages:** TypeScript, Swift, Python, C, C++, JavaScript, SQL, Bash, SML
- **Web & Backend:** Next.js, Node.js, React, Vite, FastAPI, REST APIs, WebSockets, WebAuthn, Tailwind, Flask, Django
- **Mobile & AI:** SwiftUI, iOS, Core ML, Apple Intelligence, Claude vision & text APIs, prompt engineering
- **Data:** PostgreSQL, Drizzle ORM, SQLite, MySQL
- **Infrastructure:** Docker, Render, Cloudflare R2, Linux, Git/GitHub
