EDUCATION

- **University of Oregon** Eugene, OR
Bachelor of Science in Computer Science June 2027

PROJECTS

- **Wick: Guess by Meaning — Semantic Word Game with On-Device AI (App Store) (Web)**
Swift, SwiftUI, Apple Intelligence, Core ML, iOS, TypeScript, Gemini, Docker, Render
 - Designed and built a daily “hot and cold” word game: players guess a secret word by meaning, not spelling, and each guess is scored by semantic similarity with Hot/Warm/Cool feedback as guesses close in.
 - On iOS, integrated Apple Intelligence’s on-device language model as “Ask the Keeper” — a yes/no helper that answers questions like “Is it alive?” without revealing the word, plus AI meaning hints — processed entirely on-device with no server round-trip, alongside streaks, shareable results, and a coin economy.
 - Built the web version (guesswick.com) with real-time head-to-head multiplayer — Race (first to solve a shared word) and Dare (pick a word and watch a friend guess it live) — powered by a Google Gemini backend for word generation and semantic scoring.
- **MakMak: Save Any Recipe — iOS Cookbook with On-Device Recipe Extraction (App Store)**
Swift, SwiftUI, iCloud, iOS, iPadOS, Docker, Render
 - Built a cookbook for iPhone and iPad that turns any recipe link, cookbook photo, or imported file into a clean, structured recipe — extraction runs entirely on-device, so saved recipes work offline with no account and no ads.
 - Shipped the full cooking workflow in SwiftUI: Cook Mode with glanceable text and per-step timers, serving scaling with US/metric conversion, and meal planning that compiles the week into an aisle-sorted grocery list — recipes live on-device and sync through the user’s own iCloud, with an optional Pro cloud-import service running in Docker on Render.
- **Pawl — Commitment Lock for Quitting Gambling (App Store)**
Swift, SwiftUI, Screen Time, hardware security keys, Supabase
 - Built an iPhone commitment device that blocks sportsbook, casino, and betting apps and websites through Apple’s Screen Time API, showing a “Locked by Pawl” shield with no unlock button.
 - Gated unblocking behind a physical FIDO2/USB-C security key the user keeps out of reach, plus a 15-minute cooling-off timer that auto-relocks — turning an impulsive relapse into a deliberate choice.
 - Added recovery features: a clean-day streak that survives deleting and reinstalling the app, an urge button, a relapse log, and an optional Supabase-backed sponsor who approves unlock requests and is alerted if protection drops.
- **Progressive Gin — Offline Progressive Rummy Card Game (App Store)**
Swift, SwiftUI, iOS
 - Built a fully offline Progressive Rummy game — seven escalating rounds against a cast of AI opponents with buy-the-pile and meld mechanics — with no ads, in-app purchases, or tracking.
 - Designing a full online multiplayer mode as the next milestone, extending the engine to real-time head-to-head play.

EXPERIENCE

- **UO Tutoring and Academic Engagement Center** Eugene, OR
Math & Computer Science Tutor Sept 2024 – Present
 - Diagnose logic, syntax, and runtime errors across Python, C, and C++ using systematic debugging strategies (binary search, invariant checking, stack inspection).
 - Explain recursion, memory models, pointer semantics, and core data structures with examples calibrated to each student’s background.

SKILLS

- **Mobile & AI:** Swift, SwiftUI, iOS, iPadOS, Core ML, Apple Intelligence, iCloud, Claude API, prompt engineering
- **Languages:** Swift, TypeScript, Python, C, C++, JavaScript, SQL, Bash
- **Web & Backend:** Next.js, Node.js, React, FastAPI, REST APIs, Flask, Django, Tailwind
- **Data:** PostgreSQL, MySQL
- **Infrastructure:** Docker, Render, Supabase, Xcode, Linux, Git/GitHub
